

CHAPTER 10

10.0 | Project Development and Prioritization

This chapter summarizes how transportation projects were developed and evaluated in the 2045 MTP.

10.1 | Project Development

PROJECT IDENTIFICATION

Roadway capacity and intersection improvement projects were identified from the:

- Public Outreach Survey,
- MPO staff,
- KYTC,
- TDOT, and
- previous plans.

Public Transit projects and programs were identified from the CTS Comprehensive Operation Analysis and the MPO's TIP under the assumption that public transit will continue to operate at similar levels in the future. There was no anticipated change in the level of service for the MTP. Bicycle and pedestrian projects were identified from the Public Outreach Survey and the Clarksville-Montgomery County Greenway and Blueway Master Plan.

PROJECT COST ESTIMATES

Roadway Project Cost Estimates

Cost estimates for some projects (those that are in the current TIP) were available from KYTC, TDOT, or local public agencies. For project types without provided cost estimates, it was necessary to develop them. Where such construction estimates were not available, the study team prepared order-of-magnitude cost estimates, in 2017 dollars, based on projects in the historic funding database. The typical construction cost estimates for various types of improvements are shown in Table 10.1.

No cost estimates were made for maintenance projects such as bridge and pavement projects, other than overlays.

CHAPTER 10

TABLE 10.1 CLARKSVILLE URBANIZED AREA MTP 2045 TYPICAL PROJECT COST BYIMPROVEMENT TYPE (2017 DOLLARS)

Improvement Type	Avg. Cost	Unit
New 2 Lane Roadway	\$4,500,000	Mile
New 4 Lane Arterial	\$10,000,000	Mile
Interstate Widening	\$10,000,000	Mile
Arterial Widening	\$5,200,000	Mile
Center Turn Lane	\$2,800,000	Mile
Reconstruction	\$1,950,000	Mile
Overlay	\$500,000	Mile
Intersection Improvement	\$900,000	Each
Interchange Improvement	\$5,650,000	Each
New Interchange	\$25,000,000	Each

CHAPTER 10

Public Transit Project Cost Estimates

The annual cost of operating public transit in the MPO was taken from the current levels of expenditures shown in the CTS Comprehensive Operational Analysis (COA). It was assumed that any local costs above and beyond those required to match federal funds in the TIP will grow in proportion to the increase in revenues. This increase will continue to be paid by local sources. CTS uses the funds it receives to satisfy operating needs first. Any remaining funds are then used to repair and replace assets as needed to maintain a State of Good Repair; with safety concerns being placed first.

The City of Oak Grove has proposed a transit system for the city that would operate a single 15 passenger bus. The cost estimates for this project include \$61,000 in initial capital costs and \$75,000 in yearly operating costs.

THE COA ALSO IDENTIFIES FIVE POTENTIAL CAPACITY PROJECTS. THESE ARE:

- The creation of a downtown circulator for \$294,000.
- Creating a circulator route on Fort Campbell for \$324,000.
- Splitting Route 5 for \$267,000.
- Splitting Route 8, which is expected to have a negligible cost.
- Discontinuing Route 812, which will result in a savings of \$30,600.

The CTS COA identifies cost estimates for projects from FY2017 through FY 2022. Project cost estimates for CTS after FY2022 are unavailable. Figures 10.1 through 10.3 display the project costs identified in the CTS COA.

CHAPTER 10

Bicycle and Pedestrian Project Cost Estimates

Many of the projects identified in the Greenway and Blueway Master Plan are anticipated to be built as part of another roadway project. These project costs are assumed to be part of the larger roadway project cost.

For those bike and pedestrian projects that are not part of another roadway project, the average cost for a 5-foot wide sidewalk is \$205,000 per mile. The average cost of an 10-foot multi-use path is \$410,000.

10.2 | Roadway Project Prioritization

To maximize the amount of limited funding available within the MPA, roadway capacity projects were prioritized. ITS projects that are part of, or conform, to the ITS Architecture justified by local/state departments do not require prioritization. The same applies to high priority Maintenance and Operations (MO) projects. They can be implemented by the MPO and its partner agencies, and are funded through the various programs highlighted in Chapter 9: Forecasting Future Available Funding.

Table 10.2 shows the criteria and weights that were utilized to prioritize the identified roadway capacity projects. Table 10.3 shows how these criteria were measured. The results of this prioritization exercise are shown in Table 10.4 and illustrated in Figure 10.4.

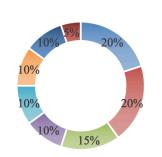

CHAPTER 10

TABLE 10.2 R	OADWAY CAPACITY PROJECT PRIORITIZATION CRITERIA	A	
Criteria	Rationale	Maximum Points	Addresses MTP GOAL
Reduce Congestion	Prioritize projects with congestion reduction.	20	Goal 4
Improve Safety	Unsafe areas should receive priority over other areas.	20	Goal 1 and Goal 2
Minimize Impacts on Natural Environment, Preserve Air Quality	Avoid negative and costly environmental impacts.	15	Goal 3 and Goal 5
Balance Benefit vs Cost	Projects with benefits exceeding construction costs should be considered first, and maximize limited federal funds.	10	Goal 5
Potential Impact to Minority and Low-Income Population*	Avoid disproportionately high and adverse impacts to Environmental Justice (EJ) groups.	10	Goal 5
Provide Pedestrian and Bicycle Facilities	Encourage projects that have the potential to improve bicycle and pedestrian conditions.	10	Goal 3
Improve Freight Movement, Support Economic Development	Encourage projects that benefit the movement of people and goods. Encourage projects that may result in the growth of economic corridors.	10	Goal 3, Goal 4, and Goal 5
Plan Consistency	Encourage projects that have been vetted in locally-adopted plans or existing studies or plans.	5	Goal 3

*If a roadway project going through an Environmental Justice area receives support from its minority and lowincome community, a project will receive maximum points for this criterion.

The project scoring criteria developed from the public participation process are used only for the roadway capacity projects analyzed in the MTP. Maintenance projects cannot be modeled, and therefore cannot be scored. However, the MPO's maintenance needs are covered in line-item funding. Prioritization of the maintenance projects is on a case-bycase basis, determined by the MPO.

PROJECT SCORING BREAKDOWN

- Reduce Congestion
- Improve Safety
- Minimize Impacts on Natural Environment, Preserve Air Quality
- Air Quality Balance Benefit vs Cost
- Potential Impact to Minority and Low-Income Population*
- Population* Provide Pedestrian and Bicycle Facilities
- Improve Freight Movement, Support Economic Development
- Plan Consistency

CHAPTER 10

10.3 | Transit, Bicycle, and Pedestrian Projects

The potential transit projects for the MPA were discussed in Section 10.1. Potential bicycle and pedestrian projects are displayed in Table 10.5.

Additional projects may be developed from the priorities listed in the Greenway and Blueway Master Plan, and the Sidewalk Construction Priority Map.

LOCATION	From	То	IMPROVEMENT
8th Street	College Street	Kraft Street	Stripe shared lanes for autos and bikes and allow on- street parking on west side
Farris Drive	Drane Street	8th Street	Stripe shared lanes for autos and bikes and allow on- street parking on west side
2nd Street	College Street	Commerce Street	Replace western travel lane with angled back-in on- street parking and mark eastern travel lanes as shared lane for autos and bikes
2nd Street	Commerce Street	Madison Street	Replace western travel lane with parallel on-street parking and mark eastern travel lanes as shared lane for autos and bikes
3rd Street	Madison Street	Commerce Street	Replace western travel lane with angled back-in on- street parking and mark eastern travel lanes as shared lane for autos and bikes
3rd Street	Commerce Street	College Street	Replace to include parallel on-street parking on east side, one northbound travel lane, and a 5' bike lane
College Street	2nd Street	Riverside Drive	Stripe 7-foot bike lane on both sides
Marion Street	1st Street	8th Street	Stripe 4-foot bike lane on both sides
Kraft Streetscape	College Street	Riverside Drive	Reconstruct roadway including median and urban curb and gutter drainage with bike lanes and sidewalk
College Streetscape	Ford	2nd Street	Implement cross section with wide outside shoulders
Residential Sidewalks	All	All	Construct sidewalk on residential streets where none exist
Main Streetscape	Riverside	2nd Street	Construct sidewalk (Riverside to 1st), add bulbouts with trees and/or bioswales (Public Square to 2nd)

CHAPTER 10

10.4 | Intersection Projects

Currently, most of the congested roadway segments within the MPA are near intersections or Interstate interchanges with high traffic volumes. Intersection improvements such as signal retiming, additional turn lanes, ITS improvements, and more could reduce congestion and delay on the MPA's street and highway network. Many of these projects can also increase intersection safety. These improvements are low-cost and can be implemented in a timely manner. Some intersection improvements, such as the addition of traffic signals, will require additional studies to see if they are warranted.

The intersection projects displayed in Table 10.6 were developed from the comments received in the Public Outreach Survey. According to the respondents, these locations experience high congestion or safety concerns. Table 10.7 displays the intersection projects that the CUAMPO analyzed for potential inclusion in the MTP.

Location	IMPROVEMENT
101st Airborne Parkway/Warfield Boulevard @ Wilma Rudolph Boulevard	Add signage
Ashland City Road @ Glendale Drive	Add turn lanes
Beechaven winery @ Dunlop road	Add traffic signal or roundabout

CHAPTER 11

11.0 | Implementation Plan

11.1 | Fiscally-Constrained Staged Improvement Program

THE 2045 MTP'S STAGED IMPROVEMENT PROGRAM IS A FISCALLY-CONSTRAINED LIST OF TRANSPORTATION PROJECTS THAT REPRESENT THE CLARKSVILLE MPA'S PLANNED FUTURE TRANSPORTATION IMPROVEMENTS.

Projects included in the staged improvement plan become eligible for federal and/or state funding assistance through the funding sources listed in Chapter 9.

During plan development, the approach was to identify the region's transportation needs and consider multiple alternatives for meeting them. In many cases, additional studies may be required in order to determine the most effective and feasible improvement alternative.

The projects identified in the staged improvement program are meant to convey the type of improvement that would make the most sense based on currently available information.

This approach acknowledges the inability to avoid all future traffic congestion by simply building as much roadway capacity as the anticipated demand for travel would seem to require. It also recognizes the reality of induced demand, a condition where more of a good is consumed in response to an increase in supply. For roadways, this results in increased traffic being generated as a response to increased roadway capacity.

One principle that guided the plan development was the idea that alternative travel options should be made available wherever possible.

Possibilities include new or improved parallel routes or modal choices that serve the same origins and destinations. Where a need for additional roadway capacity is projected, the preferred response may not be a wider facility, but enhanced operational efficiency. Improvements can be achieved using access management, Transportation System Management (TSM), TDM, or ITS strategies that serve to optimize the performance of a facility.

CHAPTER 11

PROJECT STAGING PHASES AND APPLYING FISCAL CONSTRAINT

The staged improvement program is a long-range plan for transportation improvements in the Clarksville MPA. The plan covers the 27-year period from 2016 to 2045. Note that the tables and references for the Staged Improvement Program show Stage I beginning in 2018 as the years 2016 and 2017 have already passed.

Recommended improvements are distributed among three stages:

- Stage I covers the short-term period from 2018 through 2026;
- Stage II corresponds to the intermediate period from 2027 through 2036; and
- Stage III is the long-range period from 2037 through 2045.

The assignment of a given project to a particular stage was largely determined by:

- The prioritization of projects discussed in Chapter 10
- Estimated funding available for each stage of the plan
- Project cost
- Other mobility-related considerations (such as safety, emergency evacuation, access to developable areas, etc.)

Table 11.1 summarizes the total costs of the projects selected to be funded in the 2045 MTP, including Line Item funding. Line item funding includes operations, maintenance, and funding for non-capacity improvements. Data from the MPO's partners and public outreach survey were used to develop a 2017 average annual cost for line item funding and is shown in Appendix F. The forecast development for these funding categories is also shown in Appendix F. The total cost of transit, pedestrian, intersection, and bikeway projects selected from those in Chapter 10 for funding through the MTP cannot exceed the funding from the Line Item categories in the Staged Improvement Program. The table also displays all forecast state and federal revenues, (with local match funding) anticipated to be available for implementing transportation projects through 2045. The anticipated state and federal roadway funding, with local match funding, for the plan period (2018–2045), was calculated to be \$2.15 billion. **The estimated total cost of improvements, as identified in the staged improvement program, is \$2.15 billion.**

This falls within acceptable programming limits of available funding. Therefore, the 2045 MTP is fiscallyconstrained.

CHAPTER 11

	2018-2026	2027 - 2036	2037 - 2045	2016 - 2045
Estimated Funding Available	\$61,784,942	\$90,969,074	\$108,340,270	\$261,094,286

STAGED IMPROVEMENT PLAN AND CONFORMITY

Since the CUAMPO must conduct conformity analysis for its MPA, projects identified in the MTP must be identified as being Exempt, Non-Exempt, or Regionally Significant. Projects that are exempt are not subject to the transportation conformity rule. Projects that are non-exempt must be shown in the region's conformity analysis. Projects that are regionally significant are non-exempt projects that are on roadways that serve regional needs, such as access to and from the area outside of the region, major activity centers in the region, major planned developments such as new retail malls, sports complexes, etc., or transportation terminals.

The tables for each stage of the Staged Improvement Program display the conformity status of each project. The transit projects identified in Chapter 10 were determined to be exempt from conformity analysis.

C

CHAPTER 11

PROJECT COSTS AND LINE ITEMS

The initial project costs developed in Chapter 10 were in 2017 dollars. Due to inflation, these projects costs will increase over time and it was necessary to adjust the costs based on the stage in which a project is programmed to be built. This was accomplished by multiplying the 2017 cost by a factor that is based upon the state inflation rates and mid-point of the stage time period. These calculations are shown in Appendix F.

Line item funding covers a variety of transportation projects that provide non-capacity improvements or maintenance needs. These line items include enhancements, safety, bridges, overlays, and maintenance.

- Enhancement projects include bicycle/pedestrian facilities, multi-use trails, lighting, and landscaping.
- Safety projects include turn lanes, roundabouts, traffic signals, guard rails, and signage.
- Bridge projects include bridge replacements and new bridges.
- Overlay projects are those that resurface a roadway with asphalt.
- Maintenance projects include pothole repairs, surface sealant, guard rail repair, sign replacements, debris removal, and roadway sweeping.

The development of the line items funding breakdowns is discussed in Appendix F.

STAGE I (2018-2026) PROJECTS

Stage I is planned for improvements in the years 2018 to 2026. A list of these projects is shown in Table11.3. These planned improvements are projected to cost \$536.7 million and will be funded with local, state, and federal funds. Project improvements consist of roadway widening, new roadway construction, and reconstruction.

TABLE 11.3 2045 MTP STAGED IMPROVEMENT PROGRAM - STAGE I (2018-2026)

ID	Mode	Route	LOCATION	PROJECT DESCRIPTION	Project Cost (\$000)	Conformity Status

CHAPTER 11

EFFECTIVENESS OF FISCALLY-CONSTRAINED PROJECTS

Tables 11.6 and 11.7 show the travel impacts of implementing the capacity projects in the fiscallyconstrained project list. The tables compare network statistics against the "No Build" E+C network. Figure 11.1 displays these projects.

While daily vehicle miles traveled decrease by less than one (1) percent, the daily vehicle hours travelled and daily hours of delay decrease by thirty-four (34) and forty-seven (47) percent respectively by implementing the projects recommended in the 2045 MTP.

Measure	2045 Existing and Committed	2045 Fiscally Constrained MTP	Difference	Percent Difference
Daily Vehicle Miles Traveled	6,923,236	6,954,406	31,170	0.5%
Daily Vehicle Hours Traveled	522,963	345,200	-177,763	-34.0%
Daily Hours of Delay	375,722	198,147	-177,575	-47.3%

CHAPTER 11

CHAPTER 11

11.2 | Visionary (Unfunded) Roadway Projects

The previous section addressed transportation improvements with identified funding sources. However, many unfunded transportation improvements may further improve travel conditions. These projects have been included in a Visionary Needs list to keep a record of future needs.

Unfunded transportation improvements are not necessarily less important or effective; they just cannot be accommodated within the financially constrained budget. Delayed funding for an improvement project may be the result of its:

- size
- cost
- design complexity

- acquisition difficulties
- jurisdictional concerns
- environmental concerns

A project may be delayed if its efficiency is minimized until other projects are completed; or it does not alleviate existing transportation deficiencies.

CHAPTER 11

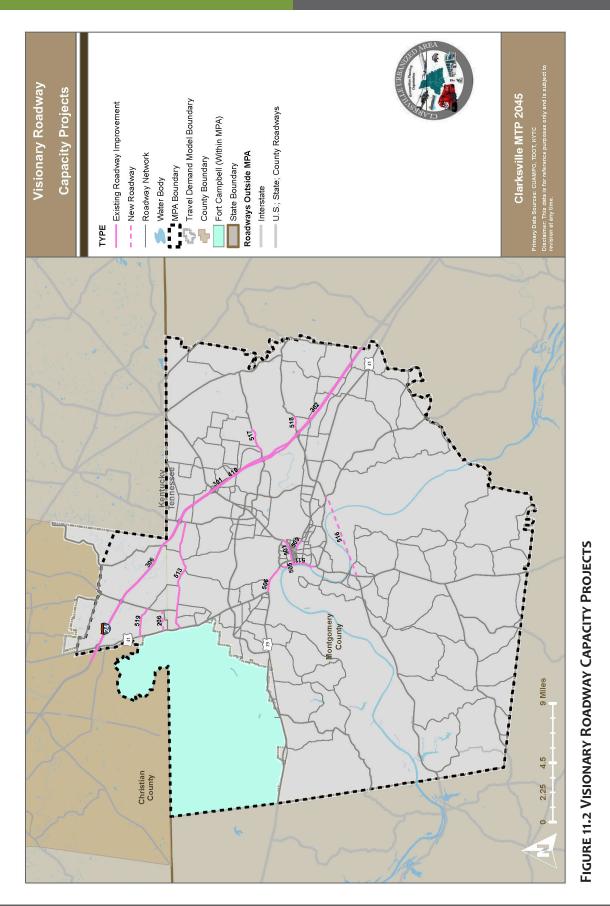

The estimated cost, in 2017 dollars, to implement the unfunded projects is \$530.8 million. The Visionary Needs list is shown in Table 11.8 and the projects are shown in Figure 11.2. TABLE 11.8 2045 MTP VISIONARY NEEDS LIST

CHAPTER 11

11.3 | Allocation of Funds to Communities of Concern

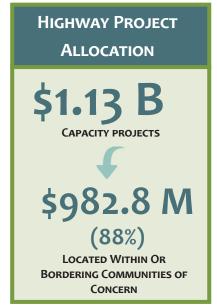

Communities of concern are cities and communities where the percentage of low-income households or minorities is greater than that of the entire MPA. Within the MPA, 27 percent of the population are minority persons, while 18 percent of the households are below the poverty line. In order to ensure equity in the plan, an analysis was conducted to determine the level of investment that will occur near these identified populations.

Highway Projects

The staged improvement program contains \$1.13 billion in capacity projects throughout the MPA. Of that amount, \$982.8 million is located within (completely or partially) or bordering communities of concern. This represents approximately 88 percent of the total dollars invested in capacity projects. The staged improvement plan projects that are within or bordering communities of concern are shown in Table 11.9. The MTP projects and communities of concern are displayed in Figure 11.3.

Each of the projects in Table 11.9 received an assessment of the likely impacts to residential properties, businesses, and community facilities in order to determine a "Level of Concern". The majority of these projects involve widenings or roadway extensions into primarily undeveloped areas, or areas with few right-of-way concerns. Overall, the level of concern for each of the projects is relatively low. However, the scope and resources of the MTP

only allow for a preliminary analysis to be conducted. Further research will need to be done as a project progresses through the development process.

FIGURE 11.3 COMMUNITIES OF CONCERN

CHAPTER 11

Roadway Safety and ITS Projects

These projects often require little or no right-of-way acquisition. They also provide positive impacts on the residents and businesses due to increased safety and reduced congestion issues. As such, these projects will only benefit communities of concern. Roadway safety and ITS projects can be developed at the same time as other highway improvements. The MPO has also identified the Dynamic Message Signs on I-24 within the Tennessee portion of the MPA as a visionary ITS project, based on the Regional ITS Architecture.

Transit Projects

The identified transit projects in Chapter 10 continue operating assistance for transit services and capital assistance for bus replacements, replacement and upgrade of miscellaneous capital equipment, and upgrading existing facilities. There are no proposed capital investments that involve right-of-way acquisition. Within the MPA, most of the areas that contain communities of concern are well-served by the current transit routes. These communities will benefit from the plan's transit projects through increased and more reliable service.

Bicycle and Pedestrian Projects

The 2045 MTP contains recommendations for sidewalks along major commercial corridors. These sidewalks would provide additional access to transit facilities for all people, including the communities of concern. The bicycle projects identified by the Clarksville Cycling Club would promote healthier communities and create access to facilities for all residents and workers in the MPA, benefiting communities of concern. The projects identified in Chapter 10 can be located throughout the MPA. Many of these bicycle and pedestrian projects are on roadways that TDOT and KYTC currently have no planned improvements for. However, these projects may be undertaken at the same time as other TDOT or KYTC projects that may occur in the future.

CHAPTER 11

11.4 | Strategies to Improve Freight Conditions

DEPLOY REGIONAL INTELLIGENT TRANSPORTATION SYSTEMS (ITS) INCIDENT MANAGEMENT SYSTEM

The MPO works with its partner agencies to maintain the Clarksville Regional Intelligent Transportation System. This system helps to manage traffic incidents and promote more efficient traffic operations. The continuation of this system will assist in reducing freight delay in the future.

IMPLEMENT MTP ROADWAY PROJECTS

Table 11.10 shows the roadway projects funded in the 2045 MTP that are along major freight corridors or roadway segments with 500 or more estimated daily trucks. The projects are shown in Figure 11.4. These projects should create reductions in delay and safety incidents for passenger and commercial traffic in the MPA.

CHAPTER 11

11.5 Strategies to Improve Air Quality

The EPA offers education on air pollution caused by everyday transportation. Through their website, https://www.epa.gov/air-pollution-transportation, they provide users with:

- A history of reduction efforts for air pollution caused by transportation.
- An overview of how transportation contributes to air pollution.
- The types of air pollution caused by transportation.
- What users can do to reduce pollution from vehicles and engines.

Table 11.11 outlines actions the MPO can take to begin addressing the negative impacts of vehicle emissions on air quality and public health.

TABLE 11.11 ACTIONS TO REDUCE TRANSPORTATION-RELATED AIR POLLUTION EMISSIONS

Strategy	DESCRIPTION
Continue the deployment and update of the Clarksville Regional ITS Architecture as necessary.	This will improve the operational efficiency of the existing transportation system, reducing the higher level of vehicle emissions occurring at low speeds or while idling.
Encourage local governments to adopt land use regulations that encourage building urban, suburban and rural communities with housing and transportation choices near jobs, shops and schools.	Increasing the walkability of the MPO will reduce the need for trips to be made by driving an automobile. It can also be more energy efficient overall.
Implement transit and bicycle/pedestrian strategies outlined previously to reduce automobile trips.	Many of these actions will make walking, biking, and transit more attractive; thereby potentially reducing demand for travel by automobile.
Work with KYTC and TDOT to explore creating a Clean Cities coalition for Kentucky and Tennessee.	At the local level, coalitions leverage resources to create networks of local stakeholders and provide technical assistance to fleets implementing alternative and renewable fuels, idle-reduction measures, fuel economy improvements, and emerging transportation technologies.
Perform studies to identify best programmatic, policy, and infrastructure strategies to reduce regional transportation-related air pollution emissions.	These studies should focus on improving system and operational efficiencies (e.g. idle reduction strategies and traffic management), reducing travel activity (e.g. Transportation Demand Management [TDM]), and increasing the utilization of alternative fuel vehicles (e.g. ethanol, biodiesel, natural gas, propane, synthetic fuels, hydrogen, and electricity).

CHAPTER 11

11.6 | Wilma Rudolph Boulevard Corridor Study

DURING THE PUBLIC OUTREACH SURVEY, WILMA RUDOLPH BOULEVARD WAS IDENTIFIED MOST OFTEN AS THE CORRIDOR WITH THE MOST CONGESTION. DURING THE SURVEY, IT WAS ALSO IDENTIFIED MOST OFTEN AS THE CORRIDOR OF GREATEST SAFETY CONCERN.

Currently, the roadway is a five-lane urban arterial facility with two through lanes and a two-way left turn lane (TWLTL).

Crash data for the five-year period of 2012 through 2016 was used to calculate the crash rate. During that period, 3,055 crashes were reported. The average AADT of the corridor was 32,607 vehicle. The crash rate for this segment, expressed in accidents per million vehicle miles, is 10.23. The statewide average crash rate for a similar facility is 2.69. This results in a crash rate that is more than three times greater than the statewide average, indicating that the roadway is high risk.

The MTP 2045 recommends a safety and access management study be conducted on the Wilma Rudolph Boulevard corridor. Potential countermeasures that could be explored in the study include:

- Install a raised median
 - Replace the existing Two-way Left Turn Lane (TWLTL) with a raised median.
 - This treatment typically reduces the crash rates by 23 percent¹ compared to a TWLTL.
 - Could improve overall speed along study corridor by reducing disruptions from driveway traffic.
 - Reduces the number of conflict points.

Clarksville Metropolitan Planning Area | 2045 Metropolitan Transportation Plan

Wilma Rudolph Blvd. Crash Rate Comparison

¹ http://www.cmfclearinghouse.org/study_detail.cfm?stid=165

CHAPTER 11

- Driveway consolidations
 - Reduces the density of driveways along the major corridor by closing driveways, providing alternative vehicle access, access restrictions, creating shared driveways, and relocating entrances to side streets.
 - Improves traffic flow due to reduction in disruptions
- Intersection treatments
 - Add Restricted Crossing U-Turn (RCUT) for minor street traffic and optimize signal timing.
 - RCUT is an alternative intersection design characterized by prohibiting left turns and through movements from minor streets. These prohibited movements are accommodated by requiring motorists to turn right onto the major street, then make a U-turn maneuver at a median opening located 400 to 1,000 feet from the intersection.
 - RCUT intersections are operated with two phases, thereby increasing major street throughput and reducing delay and queues for the overall intersection.
 - RCUT intersections reduce the number of conflict points from 32 to 14.
 - Research shows that RCUT design could reduce overall crashes by 15 percent and injury crashes by 22 percent.

11.7 | Freight and Nonmotorized Travel Studies

According to the 2010 Census, the Clarksville MPA is not listed as a TMA. However, the population of the MPA, excluding Fort Campbell (which has a fluctuating population), is just below the TMA threshold. The region is likely to be classified as a TMA after the 2020 Census. This will require the MPO to develop a CMP as discussed in Chapter 1. As part of these efforts, the MPO could conduct additional studies to aid in the development of the CMP, as well as address some of the needs discussed in Chapter 8. The first study would be an analysis of freight needs and an identification of freight trip generation within the MPA. The second study would be a comprehensive analysis of bicycle and pedestrian facilities and needs.
